Overview

Can energy storage devices complement the hems residential energy management strategy?

In this study, to complement the HEMS residential energy management strategy, we introduce storage devices based on existing target home energy systems. Adding energy storage devices can improve the performance of the PVs and thermal electric pumps in the system, stabilize the system, enhance user economics, and balance grid loads.

Can a composite energy system be used for residential energy storage?

Currently, the application and optimization of residential energy storage have focused mostly on batteries, with little consideration given to other forms of energy storage. Based on the load characteristics of users, this paper proposes a composite energy system that applies solar, electric, thermal and other types of energy.

Can energy storage equipment improve the economic and environment of residential energy systems?

It is concluded that this kind of energy storage equipment can enhance the economics and environment of residential energy systems. The thermal energy storage system (TESS) has the shortest payback period (7.84 years), and the CO₂ emissions are the lowest.

Which case is best for solar energy storage?

From an economic perspective, Case 3 is the most favorable as it takes 7.84 years to pay for itself. From an environmental standpoint, comparing the annual CO₂ emissions of the four cases, we see that those of Case 2 are the lowest. However, more energy storage could increase the capacity of the solar system to absorb solar energy.
