## Overview

What is a battery management system (BMS)?

Received 5th September 2024 , Accepted 8th January 2025 The widespread adoption of electric vehicles (EVs) and large-scale energy storage has necessitated advancements in battery management systems (BMSs) so that the complex dynamics of batteries under various operational conditions are optimised for their efficiency, safety, and reliability.

What is a cloud BMS?

The cloud BMS, with enhanced computing power and storage, communicates with end BMSs via 5G communication protocol, processes massive battery datasets, and implements advanced algorithms for health management and remaining useful life prediction. Transfer learning is employed to construct neural networks using data from different battery systems.

What is a BMS & how does it work?

The BMS has three levels: a main controller (MBMS), a battery string management module (SBMS), and battery monitoring units (BMUs), with each SBMS supporting up to 60 BMUs. BESS batteries store and deliver DC power, while most loads use AC, requiring a Power Conversion System (PCS) or hybrid inverter.

What is BMS data storage?

For BMS applications, vast datasets containing vital parameters of the battery pack, 14,15 such as real time current, voltage, temperature, and states of each component are generated which require data storage capabilities. These datasets can be stored for analysis and performing computational studies in remote cloud servers.
