## Overview

---

What is battery balancing?

Battery balancing, or so-called battery equalization, is considered as one of the most effective methods to reduce the inconsistent effect on the battery string [ 11, 12]. For the configuration of the battery balancing, it is classified as the passive balancing method (PBM) and the active balancing method.

How does passive balancing work in a mismatched socmost battery management system?

the Mismatched SOCMost battery management systems (BMS) today include passive balancing to periodically bring all cells in series to a common S C value. Passive balancing does this by connecting a resistor across each individual cell as necessary to dissipate energy and lower the.

What is a model based balancing system?

The battery string consists of n battery cells connected in series. A MOSFET is connected in parallel to each battery cell to realize the balancing function. The model based balancing control module measures the current of the battery string and voltages of all the battery cells. Fig. 1. The schematics of the model based balancing system.

What are the different types of battery balancing?

For the configuration of the battery balancing, it is classified as the passive balancing method (PBM) and the active balancing method. The PBM usually dissipates the energy through the paralleling resistors. In contrast, the active balancing method utilizes one part of the battery string to charge another.
