

# **Can capacitors be used to store energy in wind power generation**

## Overview

---

How a wind energy storage system works?

To meet the power demand, the wind generator operates to generate power. When the power demand can be met with the wind energy generation, energy storage system is not supplying power to the load . If the demand is more than the wind power generator, energy storage system is operated along with windmill.

How a supercapacitor can be used in a windmill?

The inclusion of supercapacitor to meet the power demand is highly appreciable in the system. This will help to mitigate the high frequency fluctuations in the system. The low frequency signals can be smoothed using the battery supply. The generation of maximum power from the windmill can be implemented using the energy management system.

How is wind energy power generation and storage implemented?

In this paper, standalone operation of wind energy power generation and storage is discussed. The storage is implemented using supercapacitor, battery, dump load and synchronous condenser. The system is simulated for different power generation and storage capacity. The system is regulated to provide required voltage.

Why is battery storage important in wind power generation system?

The battery storage system in the wind power generation system can provide an improved efficiency with less consumption of the fuel. When the windmill generation is more than the required demand, it can be stored in the battery for future use .
