

Can double-glass panels generate electricity on both sides

Overview

Double-glass modules can generate electricity on both sides, so they have additional backside power generation gain than single-sided modules. Why are double glass solar panels bifacial?

Thermal stability: The identical thermal expansion coefficients of the glass layers minimize stress on solar cells during temperature fluctuations. **Dual-sided energy Capture:** Many double glass modules are bifacial, allowing them to harness sunlight from both sides.

Do dual glass panels produce more energy?

Extended power Dual glass panels can produce more electricity for an extended period of time. Three major factors contribute to this higher lifetime total energy yield. First is the total life expectancy of the product. Since the panels last longer, they produce more energy over their lifetime.

What is a double glass solar panel?

Traditional solar panels typically feature a glass front and a polymer backsheet. In contrast, double glass modules replace the polymer layer with another glass sheet, creating a robust sandwich structure. At IBC SOLAR, we use 2,0 mm x 2,0 mm glass layers, whereas some other market offerings use thinner 1,6 mm x 1,6 mm layers.

Why do solar panels have two sheets of glass?

The combined strength of using two sheets of glass makes the solar panel less prone to becoming deformed or for microcracks to form in the cells. Installing dual-glass panels on a reflective surface, like a white rooftop, can increase solar energy production.
