

Can the inverter adjust the power

Overview

How does a hybrid inverter work?

In a stand-alone grid or during grid disconnection, the hybrid inverter of the system will maintain the stand-alone grid's voltage and frequency to allow the PV inverter to continue powering the load or charging the battery, and automatically adjust the frequency to prevent the excess power of the PV inverter from overcharging the battery. 2.

How Sungrow hybrid inverter works?

In stand-alone grid operation, Sungrow hybrid inverter can set up a local grid voltage and frequency at the back-up side, the PV inverter then output PV power at MPPT mode. If the PV power is large than the power required by the back-up load, the excessive power then can be absorbed by the hybrid inverter to charge the battery.

How to test a PV inverter?

When login successfully, click "More" > "Settings" > "System Parameters". Enable "Frequency Shift Power Control". For "Frequency Shift Test", this is designed for customers to test PV inverter if it has the overfrequency derating function, which is not necessary for customer to set. Customers can set any frequency value more than 50Hz for test.

Why do hybrid inverters use fspc?

The PV inverter limits its output power accordingly. If the battery SOC falls to a lower preset value, the hybrid inverter will decrease the frequency to allow the PV inverter to output more power. FSPC also can be used when grid disconnects in on-grid system.

Can the inverter adjust the power

Power Adjustment

Prerequisites Choose Settings > Grid Parameters and check that Output mode is set to Three-phase, four-wire. Choose Power adjustment > Grid-tied Point Control > Active power and ...
