## Overview

---

In order to solve the problem of low utilization of distribution network equipment and distributed generation (DG) caused by expansion and transformation of traditional transformer capacity, considering the r.

Can distributed energy storage solve the problems of uneven distribution?

Literature [1], [2], proposed that distributed energy storage with its characteristics of flexible throughput power and fast response to energy, can effectively solve the problems of uneven distribution of DG in space and time and insufficient absorption capacity of distribution network.

Can network structure optimization improve energy storage capacity?

Proposing a network and energy storage joint planning and reconstruction strategy: This paper innovatively proposes a bi-level optimization model that combines network structure optimization with energy storage system configuration, achieving a simultaneous improvement of power supply capacity and renewable energy acceptance capacity.

Can a reconfigured distribution network improve power supply capacity?

This indicates that by sacrificing some economic performance, the reconfigured distribution network system can improve both the power supply capacity and the renewable energy acceptance capacity of the distribution network. 6. Conclusions.

Can a joint planning and reconstruction strategy enhance power supply capacity?

Addressing this strong coupling while enhancing both capacities presents a critical challenge in modern distribution network development. This study introduces an innovative joint planning and reconstruction strategy for network and energy storage, designed to simultaneously enhance power supply capacity and renewable energy acceptance capacity.
