

# Discharge sequence of solar and energy storage

## Overview

---

Can a two-stage model optimize battery energy storage in an industrial park microgrid?

Abstract: An important figure-of-merit for battery energy storage systems (BESSs) is their battery life, which is measured by the state of health (SOH). In this study, we propose a two-stage model to optimize the charging and discharging process of BESS in an industrial park microgrid (IPM).

What is dedicated energy storage?

Dedicated energy storage ignores the realities of both grid operation and the performance of a large, spatially diverse renewable energy source. Because power systems are balanced at the system level, no dedicated backup with energy storage is needed for any single technology.

How does storage shift energy in time?

Storage shifts energy in time. Storage can act as either generation or consumption, helping to maintain the balance between supply and demand at different time scales. For example, storage can provide capacity which contributes to resource adequacy during stress periods on the system.

Why do we need energy storage?

Because power systems are balanced at the system level, no dedicated backup with energy storage is needed for any single technology. Storage is most economical when operated to maximise the economic benefit of an entire system. Don't we need storage to reduce curtailment?
