

Does new energy generation have to be equipped with energy storage

Overview

Is energy storage a substitute for power?

The report includes six key conclusions: Energy storage is a potential substitute for, or complement to, almost every aspect of a power system, including generation, transmission, and demand flexibility.

What is new energy storage?

New energy storage, or energy storage using new technologies such as lithium-ion batteries, liquid flow batteries, compressed air and mechanical energy, is an important foundation for building a new power system in China, enjoying the advantages of quick response, flexible configuration and short construction periods.

How is energy stored?

Mechanical Energy Storage: Energy is stored through mechanical means, such as compressing air or using flywheels. Compressed Air Energy Storage (CAES) and flywheels are examples of this technology. **Hydrogen Storage:** Surplus electricity is used to produce hydrogen through electrolysis.

Why do we need energy storage systems?

This capability is essential for maintaining grid stability and ensuring a consistent energy supply, even when renewable generation is low. As the CFR states, the deployment of energy storage systems is crucial for achieving a green energy transition and meeting global climate targets.
