

# Does solar glass have attenuation

## Overview

---

Does solar control glass reduce heat gain?

Yes, it's highly effective in reducing heat gain and managing solar radiation. Its ability to reflect and absorb heat has been proven in both commercial and residential applications, helping create more comfortable indoor environments. What are the advantages and disadvantages of solar control glass?

.

What is solar attenuation?

Solar attenuation refers to reducing the intensity of solar radiation, particularly in terms of ultraviolet (UV) and infrared (IR) light. Solar-coated windshields attenuate UV and IR radiation. UV radiation harms your skin and the car's interior materials, leading to fading and damage over time.

Why is solar control glass important?

Solar control glass is ideal for helping to maximize natural daylight while reflecting a high proportion of solar radiation away from the glass, contributing to keeping the indoor space bright but cool. What are the benefits of solar control glass?

.

Can solar control glass reduce glare?

Solar control glass can help mitigate glare from the sun and increase the visual comfort of building occupants, particularly if a glazed façade is directly exposed to the sun and with a high window-to-wall ratio.

Solar control performance is achieved through the use of a very thin, transparent, and permanent coating that helps limit the solar energy entering inside. It helps control solar gain to various levels depending on the coating while allowing natural daylight in and views on the outside. See more about how glass is coated.
