

# **Energy Storage Container Corrosion-Resistant Product Review**

## Overview

---

Using phase change material (PCM) as the energy storage medium and applying it in a latent heat energy storage system has become an important way of new energy application. PCM has been widely used i.

Why is corrosion resistance important for macro packaging?

For macro packaging, ensuring the corrosion resistance of packaging materials in the TES system has become its main problem, because it is not only related to the safety of food in the transportation process but also related to the long-term use and complete function of the entire energy storage system , .

Which conditions affect corrosion of containers?

Other conditions which have been highlighted by Grosu et al. , that can influence corrosion of containers are materials imperfection i.e. roughness and surface defect, and salt humidity. The exposure of steel materials to molten salts at high temperatures can decrease its rupture time under constant loading .

What is corrosion inhibitor technology?

The corrosion inhibitor molecules are adsorbed on the surface of the container to form a protective layer, which greatly reduces the corrosion rate of the container in an acidic environment. At present, corrosion inhibitor technology is also developing in the field of energy storage.

Do container/encapsulation materials have corrosion/degradation phenomena?

Fundamentally, the review carried out has been able to provide understanding of container/encapsulation materials corrosion/degradation phenomena in commonly used phase change materials at low, medium and high temperature of organic, inorganic and metallic types.

## Energy Storage Container Corrosion-Resistant Product Review
