

Monocrystalline silicon flexible solar panels

Overview

What are monocrystalline solar panels?

Monocrystalline solar panels are made with wafers cut from a single silicon crystal ingot, which allows the electric current to flow more smoothly, with less resistance. This ultimately means they have the highest efficiency ratings, longest lifespans, and best power ratings on the market, ahead of all other types of solar panels.

What is a monocrystalline silicon cell?

To be used for installations without high mechanical loads. Highly efficient monocrystalline silicon cells (24%), embedded in two patented metallic grids to optimize both energy harvesting and mechanical stability. Perfect for textile installations and highly stressed panels.

What are polycrystalline solar panels made of?

Polycrystalline solar panels are made up of silicon wafers, which are typically up to 200 micrometers thick. To make a flexible solar panel, these silicon wafers must be sliced down to just a few micrometers wide.

How efficient are flexible solar panels in 2025?

In 2025, premium flexible solar panels achieve up to 22.5% efficiency for monocrystalline and 19% for CIGS technology. This makes them increasingly competitive with rigid panels while maintaining superior installation versatility.
