

# PV inverter AC overload

## Overview

---

What is a solar inverter AC overload?

An inverter AC overload occurs when the power on the AC output exceeds the inverter's nominal power to supply electricity. In fact, solar inverters can handle a certain range of AC overloads for a short period, where the inverter is subjected to a power demand spike that exceeds its rated capacity.

What happens if a PV inverter is overloaded?

Overloading an inverter can help to increase the energy yield of a PV system by allowing more DC power to be converted into AC power. However, overloading an inverter can also cause clipping, which occurs when the inverter cannot convert all the DC power into AC power. Shade is another factor that can affect the performance of PV systems.

Does AC side overloading damage the inverter?

Another scenario is that AC side overloading does not damage the inverter, which is common in on-grid inverters. For example, the SOLXPOW energy storage inverter supports not only a brief overload of twice the rated power but also a continuous AC overload of 1.1 times the rated power.

Why is my solar inverter overloaded?

Solar inverters can overload due to various reasons, including exceeding the rated power capacity of the inverter, a sudden increase in the load demand, or a fault in the inverter or the solar panel system. How Do I Know if My Inverter Is Overloaded?

If the inverter is overloaded, it may shut down or trip the circuit breaker.
