## Overview

---

What are polycrystalline solar panels?

Polycrystalline solar panels are the result of melted polysilicon being poured into moulds, which are cut into wafers and fashioned into solar cells. This type of silicon panel dominated the UK market for decades, starting with the country's very first domestic solar panel system in 1994.

Can I buy a new polycrystalline solar system?

Polycrystalline solar panels now make up 0% of global production, so you almost certainly won't find an installer offering to install a new polycrystalline system for any price. You can pay for used solar panels, but this is usually a bad idea.

Are polycrystalline solar panels suitable for residential installations?

Yes, polycrystalline solar panels are suitable for residential installations. In fact, polycrystalline is the second most common panel type used in homes. Polycrystalline panels have a moderate efficiency of 13-16%, which is less than monocrystalline (meaning they require more space to produce the same power).

Is polycrystalline the most efficient solar panel type?

No, polycrystalline is not the most efficient solar panel type. Polycrystalline panels have around 13-16% efficiency, which is less than some other types like monocrystalline, which are the most efficient panel at 15-25% efficiency.

Several fragments of silicon are melted together to form the wafers of polycrystalline solar panels. In the case of polycrystalline solar cells, the vat of molten silicon used to produce the cells is allowed to cool on See more on linquip
