

# Power station energy storage commissioning process

## Overview

---

What is a commissioning plan?

Commissioning is a required process in the start-up of an energy storage system. This gives the owner assurance that the system performs as specified. A Commissioning Plan prepared and followed by the project team can enable a straightforward and timely process, ensuring safe and productive operation following handoff.

Do energy storage systems need a safety assessment?

**Safety Assessment:** As more energy storage systems have become operational, new safety features have been mandated through various codes and standards, professional organizations, and learned best practices. The design and commissioning teams need to stay current so that required safety assessments can be performed during commissioning.

What is a commissioning process?

Commissioning is a gated series of steps in the project implementation process that demonstrates, measures, or records a spectrum of technical performance and system behaviors. This chapter provides an overview of the commissioning process as well as the logical placement of commissioning within the sequence of design and installation of an ESS.

Which components of a battery energy storage system should be factory tested?

Ideally, the power electronic equipment, i.e., inverter, battery management system (BMS), site management system (SMS) and energy storage component (e.g., battery) will be factory tested together by the vendors. Figure 2. Elements of a battery energy storage system
