

Solar PV string inverter

Overview

A string inverter is a central component in solar energy systems, responsible for converting direct current (DC) electricity generated by solar panels into alternating current (AC) electricity that can be used in homes or businesses. What is a string solar inverter?

The typical string inverter will have multiple strings of PV modules connected to it. Consequently, it will have multiple inputs for these connections. Some inverters are designed with just one input and are built for small solar PV systems. These are sometimes called single-string solar inverters. A multi-string solar inverter has multiple inputs.

Are string inverters a good choice for a solar PV system?

Solar PV systems rely on efficient conversion of solar energy into usable electricity, and string inverters play a crucial role in this process. For many small to medium-sized installations, string inverters offer a balanced solution in terms of cost, efficiency, and scalability.

What is a string inverter system?

A string inverter system aggregates the power output of groups of solar panels in your system into "strings." Multiple strings of panels then connect to a single inverter where electricity is converted from DC to AC electricity.

How many solar panels can you string to one inverter?

For example, you may have three strings of five panels each, for a total of fifteen panels on a single string. The size of the string inverter in kilowatts (kW) and the wattage of the solar panels you use will determine how many panels you can string to one inverter without wasting energy.
