

# Solar glass room selection

## Overview

---

How do I choose a solar control glazing option?

When choosing a solar control glazing option, it's essential to consider factors such as orientation, location, and building use. For example, buildings with large south-facing windows may benefit from a combination of passive and active solar control glazing options to optimize energy efficiency and indoor comfort.

What are the different types of solar control glazing?

There are various types of solar control glazing available, from passive options such as tinted glass and reflective glass to active options such as photochromic glass and electrochromic glass. Each option has its unique properties, performance, and applications, and it's essential to choose the right option for your building's needs.

What is solar control glazing?

Solar control glazing is a type of glass that is designed to control the amount of solar heat that enters a building. It is an essential component of building design in warm climates, where excessive heat gain can lead to uncomfortable indoor temperatures, increased energy consumption, and higher cooling costs.

What is passive solar control glazing?

Passive solar control glazing, such as tinted glass and reflective glass, is typically less expensive and easier to install than active solar control glazing, such as photochromic glass and electrochromic glass.
