Overview

How do you turn on a solar inverter?

Always follow the manufacturer's instructions, but the standard procedure is "AC on, then DC on." First, turn on the AC breaker feeding the inverter to power its internal controls and allow it to sync with the grid. Then, close the DC disconnect to send power from the solar panels. Reversing this can stress or damage the inverter.

Should I wire my solar array to an inverter?

Wiring your solar array to an inverter is where precision and safety converge to define system performance. This guide provides a clear, actionable blueprint—from component selection and wire sizing to final commissioning—to ensure a robust, efficient, and safe solar energy system.

How do you connect solar panels to a solar inverter?

First, connect individual solar panels into "strings" by linking the positive lead of one panel to the negative lead of the next using their MC4 connectors. This series connection adds the voltage of each panel together, creating a higher string voltage that is more efficient for the inverter.

What is MPPT in a solar inverter?

MPPT is a feature in modern inverters that constantly adjusts the electrical operating point of the solar array to extract the maximum possible power. It's an algorithm that accounts for changing conditions like sunlight intensity and temperature to optimize energy harvest throughout the day. 7. Why must overcurrent protection be DC-rated?
