How can on-site solar PV & energy storage improve sustainability?

To achieve sustainability goals while meeting the increasing electricity demands of electrification, organizations are pairing on-site solar PV generation with on-site energy storage. These systems, which are considered as “behind-the-meter” (BTM) systems, allow facilities to maximize the benefits of on-site renewable generation.

Can optimum solar PV tilt angles be used to achieve maximum energy generation?

This study aimed to develop a novel and easily adaptable technique that would enable the attainment of the maximum possible energy generation from PV setups installed at specific geographical locations through the determination of optimum solar PV tilt angles.

What is the relationship between solar module position and angle?

The quantity of power produced by a module is directly related to the amount of solar energy that reaches or strikes its surface. Therefore, it is crucial to comprehend the correlation between the position of the sun and the angle at which the PV module is tilted.

Can on-site storage be used alongside solar PV?

If a utility restricts the exports from a facility to the grid, the use of on-site storage alongside solar PV can provide a solution to avoid costly infrastructure upgrades, thus increasing the feasibility of larger on-site PV installations.
