

# Temperature difference wind power generation system

## Overview

---

Why is wind power generation correlated with temperature?

Similarly, wind power generation exhibits seasonal variations correlated with temperature. In most parts of China, due to the influence of Asian high pressure, high power and high wind are more likely to occur in cold winter, while the wind speed is low in summer.

Does temperature affect wind power output?

Firstly, the influence of temperature on wind power output is analyzed via Pearson coefficient to obtain the correlation between wind power and temperature.

How is wind power output based on the historical wind power curve?

Secondly, based on the historical wind power curve, a large number of wind power output scenarios are randomly generated while fully preserving its characteristics, and probabilistic supply-demand analysis is carried out.

Is a stochastic and extreme scenario generation method suitable for wind power?

In the context of large-scale wind power access to the power system, it is urgent to explore new probabilistic supply-demand analysis methods. This paper proposes a wind power stochastic and extreme scenario generation method considering wind power-temperature correlations and carries out probabilistic supply-demand balance analysis based on it.

## Temperature difference wind power generation system
