

Two identical lithium iron phosphate battery packs connected in parallel

Overview

A thermal-electrochemical coupled model framework considering mass balance, charge balance, reaction kinetics, and energy balance is developed to evaluate thermally-driven imbalance among cells of a com.

Can I connect lithium iron phosphate (LFP) batteries in parallel?

If you have ever sought information about connecting Lithium Iron Phosphate (LiFePO₄ or LFP) batteries in parallel for your application and been left confused by conflicting information, let me clear the buzz and explain why some sources allow us to connect LFP batteries in parallel and others do not recommend it at all.

Why do lithium ion batteries need to be connected in series?

To meet the power and energy requirements of the specific applications, lithium-ion battery cells often need to be connected in series to boost voltage and in parallel to add capacity . However, as cell performance varies from one to another [2, 3], imbalances occur in both series and parallel connections.

What happens if you connect two lithium batteries in series?

Two 12.8V-100AH lithium batteries connected in series becomes a 25.6V-100AH battery bank with 2560 watts of stored energy potential to 100% DOD. Connecting batteries in Series increases the battery bank voltage and total stored energy.

What happens if two batteries are connected in parallel?

First, we need to understand that when two or more batteries are connected in parallel, the current flowing through each battery is unlikely to be equal. For example, imagine you have a battery system consisting of two 12V 100Ah batteries connected in parallel.
