

Using air separation system to store energy

Overview

Can air separation system save energy?

Based on the TSI ideas above, energy-saving opportunities are discussed. The air separation system is simulated based on the industrial data by using ASPEN PLUS. According to the simulation results, the actual operating performance and exergy efficiency of major equipment are analyzed. The major problems of this process are discovered.

Can air separation devices produce and store cryogenic liquid air?

So, if we use air separation devices to produce and store cryogenic liquid air, and then implement DSM on it, we not only can fully realise the production potential of air separation devices and achieve the large-scale storage of liquid air, but also can reduce the investment and power consumption cost of the energy storage system.

What is a novel Air Separation Unit (ASU)?

Novel air separation unit (ASU) proposed with energy storage and power generating. Large-scale liquid air energy storage method realized by applying on ASUs. High-grade liquid air cold energy recovered for air separation processes. Energy storage method with scale effect on ASU cost saving and peak load shifting.

Can air separation units balance demand on a power grid?

Air separation units (ASUs), as a single industrial equipment item, accounted for a considerable proportion (4.97%) of China's national total power consumed. Therefore, combining with energy storage technology and implementing demand side management on ASUs can balance the demand on a power grid and bring economic benefits to various enterprises.
