

What is the appropriate size of a home inverter

Overview

How big should a solar inverter be?

To account for power losses assume an 80 percent efficiency. Your solar inverter should have a similar or slightly higher wattage rating than the DC output of your solar panels (which in this case is 4.5 kW). You can size it between 1.15 and 1.5 times larger. The rule of thumb is to size your inverter 1.25 bigger than your solar array.

How do I choose the right inverter size?

Knowing the power consumption of each device is the first step in determining the appropriate inverter size. The wattage of each device can typically be found on its label or user manual. The formula to calculate wattage is:
Wattage (W) = Voltage (V) × Amperage (A) For example, a refrigerator may use 200W, while a fan might consume 70W.

How much power does an inverter need?

For example, if your total running wattage is 2200W and your surge wattage adds another 400W, your total power requirement is 2600W. Inverters typically operate at an efficiency of around 85%-95%. To ensure your inverter can handle your total load, divide your total power consumption by the inverter's efficiency.

How to choose a solar inverter?

Choose an inverter that has a surge watt rating equal to or greater than this value. As for voltage drop, check the wire length between your solar panels and the batteries. If the wire length is long, you may need to choose a lower voltage system (12V, 24V, or 48V) to minimize voltage drop.
